CSS Customization

While editing the book's cover page, you can include custom CSS into the *Custom CSS* field, and this will be applied to all chapters in the book.
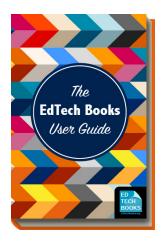

This is very powerful and can have undesired effects, because the CSS is applied to the entire page (not just the chapter contents). For instance, including a line like the following

```
body { color: pink; }
```

would make all text in the book pink, including the author bios and other non-content elements.

To prevent CSS from changing site formatting unexpectedly, you can limit your adjustments to only apply to content within the *article* tag or the *#chapter-container* id as follows:

article h2 { color: pink; }
#chapter-container div.callout h3 { background-color: #6fbada; }
