Introduction

The Purpose of This Resource

Thank you for your interest in improving wellbeing in schools. This resource will help you establish a foundational knowledge for effectively utilizing wellbeing principles, measures, and interventions to support your school’s potential to flourish. Before you begin, please note this resource is not intended as a comprehensive compilation of wellbeing resources and materials. We purposefully chose a wide variety of valid, reliable, school-friendly measures and interventions for you to consider and implement in the desire you share with us to improve wellbeing at your school.

We encourage you to use this resource to supplement your personal research. It may provide a starting point for further learning that will enable you to become the wellbeing expert in your various contexts. The references for each consideration, measure, and intervention are directly below its corresponding section. We encourage you to review each original source as you consider applying this research in your life and in your school. Similarly, the bulleted summary at the end of each consideration section should be used as a reminder of important content and should not undermine the necessity of reading each section and performing your own research. We hope this report provides the information and support you need as you improve your personal as well as your school’s wellbeing.

If there are wellbeing measures, interventions, research, or general
feedback you would like us to be aware of, please email them to meganwasden@gmail.com.
Why Is Wellbeing Important in Schools?

There are many ways to answer this question: Why is wellbeing important in schools? We could focus on impacts of wellbeing on test scores or classroom management. We could illustrate the advantages relating to productivity, classroom communities, or teacher relationships. While we will touch on many of these benefits, the most important reason to care about wellbeing is that we, as leaders, have been trusted with the world’s most valuable resource: children. Each student who frustrates us, confuses us, delights us, and impresses us has intrinsic worth and potential. It is a sobering and significant stewardship to be a part of the classroom/school community life that prepares children to “[inherit] resources of the race, and to use [their] own powers for social ends” (Dewey, 1897, p. 78). Thus we should focus first and foremost on wellbeing because we truly care about the students entrusted to us, recognize our moral obligation to nurture those within our stewardship, and want the best for them both now and in the future.

Traditionally schools have focused on students’ current needs or short-term victories (e.g., mastery by the end of a unit or term, likelihood of graduation, etc.). However, these short-term items fall short in benefiting students compared with the life-long advantages of wellbeing. Ed Diener (2011) wrote,

[Happiness] is emotional capital we can spend in the pursuit of
other attractive outcomes. Research shows that happy people live longer, succumb to fewer illnesses, stay married longer, commit fewer crimes, produce more creative ideas, work harder and better on the job, make more money, and help others more. (p. 20)

Fostering and teaching wellbeing is a way to show students and educators we care about them and want to support them by enabling them with short- and long-term benefits. It means depositing knowledge and dispositions into an account that may someday fund their future marriage, health, profession, creativity, and success. Isn’t that what we really want for each student?

But why does wellbeing need to be specifically prioritized in schools? Schools touch nearly everyone from faculty and students to parents and community leaders. Schools have the potential to share humanity’s resources while enabling youth; including wellbeing in our students’ educational experiences can naturally extend established purposes of schooling. Overall wellbeing enhances intrinsic motivation, decreases disciplinary problems, increases academic achievement, improves school satisfaction and leads to flourishing of individuals, communities, and nations (Buecker et al., 2018). Simply put, those who feel better can learn better. Research has found that “inducing positive emotions (such as joyfulness, love, or appreciation) enlarges cognitive perspectives and enhances the ability of individuals to attend to more information, make richer interpretations, and experience higher levels of creativity and productivity” (Cameron, 2012, p. 26). Our best learners and teachers are those who have the skills, resources, and environments necessary for them to experience wellbeing and reap the benefits of feeling good and learning more. Even more benefits are connected to individual aspects of wellbeing.

Facets of wellbeing, such as gratitude, hope, and emotional regulation, have been found to improve academic performance across
several areas. For example, students with high levels of hope can make adaptive attributions and overcome failure by making corrections. Thus failure ceases to be a long-term detriment to their self-worth. Similarly, gratitude increases students’ satisfaction with school and propels them in making and pursuing intrinsic goals. Gratitude is positively correlated with “higher GPAs, greater absorption in meaningful activities, more life satisfaction, and more social integration.” In addition, emotional regulation helps students get along with peers and teachers, exhibit prosocial behaviors, and adjust to new classrooms (Furlong, Gilman, & Huebner, 2014). Thus both generally and specifically, wellbeing gives our students a happy though competitive advantage both inside and outside the classroom.

Students are not the only ones who benefit from wellbeing on the agenda. Teachers who persist with low levels of personal wellbeing are more exhausted, more cynical, and more distant from their students. They question their own self-efficacy, limit their own achievements, are demotivated when faced with challenges, and are more likely to experience burn-out. In contrast, teachers who enjoy wellbeing are better able to interact, teach, and achieve (Bentea, 2017). In some cases, prioritizing wellbeing may only require a few changes to classrooms, procedures, and priorities, but these changes can lead to long-lasting positive impacts for both students and teachers.

Wellbeing does not spontaneously grow in the sidewalk cracks of time between class assignments and teacher meetings. If we are not deliberate about teaching and fostering wellbeing, students will grow up without knowing wellbeing is within their internal locus of control. Shawn Achor (2010) observed,

What was going on here [at Harvard] was that like so many people in contemporary society, along the way to gaining their superb educations, and their shiny opportunities, they had
absorbed the wrong lessons. They had mastered formulas in calculus and chemistry. They had read great books and learned world history and become fluent in foreign languages. But they had never formally been taught how to maximize their brains’ potential or how to find meaning and happiness. (p.14).

We have the opportunity to formally teach our students to maximize their potential, and prioritizing their wellbeing is a good place to start. Your first step in enabling your students and educators with the power of wellbeing is to assess it. Then respond to the assessment in ways informed by research and adapted to your context. The resources that follow will help you start or continue your efforts to optimize your school’s potential as a place of learning and flourishing.

Section Summary

- Prioritizing wellbeing is one way to nurture the whole child.
- Wellbeing provides life-long advantages in health, work, relationships, and creativity.
- The far-reaching influence of schools can be more easily adapted to foster wellbeing throughout the entire community.
- Wellbeing improves students' academic performance, behavior, social integration, and satisfaction.
- Wellbeing improves teachers' ability to interact with students, teach concepts, face challenges, and avoid burnout.

What is Wellbeing?

To understand wellbeing, we need to understand its origin in the field of positive psychology. Much of what we know about wellbeing is attributed to Martin Seligman, with roots in the study of happiness. Seligman is not only the founder of the science that studies happiness, but also the strongest critic of the word. Seligman (2011) wrote, “I actually detest the word happiness, which is so overused that it has become almost meaningless . . . The first step in positive psychology is to dissolve the monism of ‘happiness’ into more workable terms” (p. 9). He dissolved the happiness monism into a three part formula: positive emotions + engagement + meaning = happiness. This three pronged approach to happiness became his authentic happiness theory. With additional time and research, Seligman adapted his focus from happiness to wellbeing by creating the influential PERMA framework, with five principles: positive emotion, engagement, meaning, positive relationships, and accomplishment. Each principle can be independently measured, contributes to wellbeing, and is sought for its own intrinsic value.

As the field of positive psychology has grown, so have its theories about wellbeing. Tom Rath, co-author of Wellbeing: The Five Essential Elements, considered overall happiness as a product of wellbeing in five distinct areas of life. He explained,

Wellbeing is about the combination of our love for what we do each day, the quality of our relationships, the security of our finances, the vibrancy of our physical health, and the pride we take in what we have
contributed to our communities. Most importantly, it’s about how these five elements interact. (Rath & Harter, 2014, p.4).

Furthermore, he argued, long-term happiness is really about the positive short-term decisions we make in relation to our finances, relationships, physical health, community, and career.

Psychologist Ed Diener thought of happiness more simply: “Happiness is the name we put on thinking and feeling positively about one’s life.” What really matters, he continued, is psychological wealth which takes into account “life satisfaction and happiness, spirituality and meaning in life, positive attitudes and emotions, loving social relationships, engaging activities and work, values and life goals to achieve them, physical and mental health, [and] material sufficiency to meet our needs” (Diener & Biswas-Diener, 2011, pp. 4-6).

Ryff and Keyes (1995) defined psychological wellbeing as the combination of six dimensions: autonomy, environmental mastery, personal growth, positive relationship with others, purpose in life, and self-acceptance. Each of these components is designed to lead to positive functioning. Thus their model focuses more on eudaimonic wellbeing than hedonic traditions that argue wellbeing is about gratification and positive emotions. Eudaimonic wellbeing argues that happiness comes from meaning, rather than gratification and positive emotions (Goodman, Disabato, Kashdan, & Kauffman, 2017).

Another train of thought, beginning with Greenspoon and Saklofske (2001), views wellbeing as contingent on two factors: psychopathology (PTH) and subjective wellbeing (SWB). Rather than factors at opposing ends of the same spectrum, these are an integrated system building on the idea that wellbeing is not simply the absence of mental illness and struggle. More current research continues to support this model of wellbeing and differentiate among the four distinct groups that emerge on a dual factor system, “positive mental
health (high SWB, low PTH), vulnerable (low SWB, low PTH), symptomatic but content (high SWB, high PTH) and troubled (low SWB, high PTH)” (Lyons, Huebner, Hills & Shinkareva, 2012, p.183). For more information on this model of dual factors or dual continua of wellbeing, see our “Wellbeing on Dual Continua” section.

With countless researchers and authors thinking about wellbeing in such varied ways, you may have difficulty grasping what wellbeing means to your school. The references below can help you understand additional models of wellbeing to consider in making your decisions. The variety of assessments and associated definitions of wellbeing allows you to measure the facets of wellbeing that are most important to your school community. We hope these resources serve as a foundation for more customized definitions and measures of wellbeing which ultimately result in flourishing for students, teachers, parents, and school communities now and into the future.

**Section Summary**

- Several different models and theories have been proposed for wellbeing.
- Martin Seligman's PERMA framework argues that wellbeing is a combination of positive emotion, engagement, meaning, relationships, and accomplishment.
- Some researchers consider wellbeing from a domain-based perspective: as the result of flourishing across different domains of life: social, emotional, occupational, spiritual, physical, etc.
- The variety of definitions for wellbeing allows you to decide which framework and facets are most important to your context.

Rusk, R. D., & Waters, L. (2014). A psycho-social system approach to well-being: Empirically deriving the five domains of positive

Considerations: How Does Wellbeing Function in Life

Wellbeing from a Growth Mindset

Wellbeing must be approached with a growth mindset (Dweck, 2008). In applying this research to wellbeing, we must recognize that a student’s or educator’s wellbeing is not a fixed aspect of the individual’s personality. By emphasizing that anyone’s wellbeing can improve with effort and with a focus on the process, individuals will see a greater increase in wellbeing than they could achieve with a product-focused fixed mindset.

Similarly, a wellbeing measurement score should not be used to categorize a school or an individual, but should be seen as a starting place for further exploration and progression. Michael Fullan (2011), the Global Leadership Director of New Pedagogies for Deep Learning, advised,

Do testing, but do less of it and, above all, position assessment primarily as a strategy for improvement, not as a measure of external accountability. Wrap this around with transparency of practice and results and you will get more accountability all round. (p. 9)

Utilizing wellbeing measurement scores to inform progress can help school leaders and individuals select wellbeing strengths on which to
capitalize. Educators who use wellbeing scores to rank schools do so at the risk of their educators’ and students’ psychological safety, as many may become more likely to inaccurately report their wellbeing. Furthermore, there is a correlation between low socioeconomic status and low levels of wellbeing (see section on Wellbeing and Socioeconomic Considerations). Consequently, ranking schools by their wellbeing scores would not only be counterproductive and harmful to the psychological safety of the school, but would disadvantage the already disadvantaged. Instead, position the data you collect to leverage individual and organizational growth and capacity.

**Section Summary**

- Our beliefs about ability shape our efforts. Growth mindsets strengthen confidence in the ability to improve characteristics; to decrease depression, anxiety, and aggression; and to improve academic performance.
- Educators should view wellbeing from a growth mindset: (a) use scores to help schools improve and capitalize on their strengths, and (b) do not categorize schools based on wellbeing scores.

**Suggestions for Further Research**

### Wellbeing Viewed on Dual Continua

Many traditional approaches to wellbeing view an individual’s wellbeing on a single continuum based on their degree of mental or emotional struggle, defining wellbeing as solely contingent on the challenges faced. However, current research in the field of positive psychology supports wellbeing as measured on two continua: the degree to which an individual is struggling and the degree to which they are flourishing. Using both continua, struggling and flourishing, provides a more accurate depiction of an individual's experience. This approach supports the reality that many individuals experience wellbeing (flourish) despite challenges (e.g., mental illness) and takes into account the self-efficacy of those who live happily despite challenges. The diagram below illustrates the fundamental differences between the traditional single continuum and dual continua models.
One study at TheWellbeingLab surveyed over 2,000 employees using a similar dual continua model (see graphic to the right). On the single continuum model, only three groups emerged: “really struggling,” “just functioning,” and “consistently thriving.” On the dual continua model, researchers found that two separate groups emerged from the “just functioning” cohort, which represented 73% of all employees (TheWellbeingLab & Australian HR Institute, 2018). These two groups, represented by the descriptors “living well despite struggles” (light blue) and “not feeling bad, but just getting by” (dark blue), represented the experience of 37% and 36% of employees respectively (see chart below).
Acknowledging the two distinct groups that emerged from those normally classified as “just functioning” is crucial to support and foster individual wellbeing. Those who are “living well despite struggles” share more characteristics with thriving individuals. They enjoy more positive emotions, engagement, relationships, meaning, achievement, and health than those who are “not feeling bad, but just getting by.” The graphic below illustrates how the levels of each PERMAH factor for those who are “living well despite struggles” (the light blue bar) are closer to those who are “consistently thriving” (green bar) than to those who are “not feeling bad, but just getting by” (dark blue bar).
As this study shows, individuals demonstrating resilience and experiencing wellbeing despite struggles (“living well despite struggles”) do not need the same types of support as those succumbing to challenges. These resilient teachers and students do not need to be convinced of the importance and power of wellbeing as they already prioritize and experience wellbeing in their lives. Consequently, they may simply need support to recognize new resources and practice with the tools they already use to increase their wellbeing. Comparatively, those whose struggles negatively impact their wellbeing (“not feeling bad but just getting by”) can greatly benefit from learning about the importance of prioritizing wellbeing and gaining new tools to take control of and increase their wellbeing.

By conveying to students and employees that thriving is possible
despite struggles, you help create the psychological safety needed to talk about challenges and reduce the negatively associated stigmas. Conversely, without recognizing it is possible to simultaneously struggle and thrive, employees and students may feel pressure to inaccurately report their wellbeing and cover up challenges they experience (McQuaid, n.d.). Viewing wellbeing on dual continua can help you better tailor support to individuals and cultivate a school culture where internal states of wellbeing need not be controlled by external struggles.

**Section Summary**

- Wellbeing exists on dual continua of flourishing and struggling.
- Viewing Wellbeing on dual continua can help you better tailor interventions and resources to the individual needs of teachers and students. For example, some flourish despite high levels of struggle ("living Well, despite struggles") and experience wellbeing similar to those who are flourishing. These individuals do not need the same type of support as those who are languishing and experiencing high levels of struggle.
- Emphasizing that it is possible to thrive despite struggles helps foster psychological safety in schools and create an internal, rather than external, locus of control over personal wellbeing.

**Suggestions for Further Research**

McQuaid, M. (n.d.). Are our wellbeing measures doing more harm than good? Podcast and cheatsheet with Dr. Peggy Kern.
Wellbeing Impacted by the System

Individual wellbeing must be considered as existing within a system. Systems-informed positive psychology (SIPP) merges positive psychology with the holistic nature of systems science. SIPP acknowledges that systems influence the individual. Siokou (2016), a pioneer of this line of thought, explained, “Rather than seeing contextual factors as noise, [SIPP] embraces these factors and helps us understand all the different pieces that affect the individual in their daily life” (n.p.). Thus amid our individual efforts to improve our own and others’ wellbeing, our progress can be hindered or propelled forward by the organizations to which we belong. Kern, a colleague of Siokou, also a pioneer leader in SIPP, illustrated this point:

At the individual level there’s a range of positive psychology interventions that you can do to improve your own wellbeing. But if you’re working in a very dysfunctional place, even the best people are going to struggle over time, and so you need structures that will support you to really flourish. (Kern & McQuaid, n.d., n.p.)
Considering the impact of the system on wellbeing, we have included several measures and tools designed to assess and improve your school’s organizational culture.

SIPP recognizes that systems are dynamic and responsive to change, and that even though individuals are responsible for the parts of the system they influence, their environment is often out of their control (Kern, 2017). When working to improve the wellbeing of your students and educators, you must consider the systems they work within daily and recognize how these systems impact their wellbeing. Additionally, SIPP recognizes that wellbeing looks different as experienced by different people. Consequently, schools should focus on helping students and staff develop the skills to maintain their own personal balance of wellbeing (rather than attempting unsustainable constant improvement).

Furthermore, we must recognize that much of wellbeing comes from our interactions with others and can be significantly improved by a positive system. Focusing too much on our personal wellbeing may do more harm than good. Kern observed, “One of the biggest findings in the wellbeing research is that other people matter, and yet today most of the positive psychology interventions being studied are very individually focused rather than [responsive to] the ways in which our experiences are socially constructed” (Kern & McQuaid, date, page). Researchers Kern and McQuaid recommended creating a systems map to help you visualize how your initiative will impact the system, better understand and identify the pressures and values, know where to focus your attention, and analyze in which direction to move forward (Kern & McQuaid). An example of a systems map is included in the “Suggestions for Further Research” section below. As you will notice, systems maps can vary in focus, purpose, and organization. For example, Baker (2016) has recommended mapping relational energy by recording how each person in your system affects your energy from “very energizing” to “neutral” to “very deenergizing.”
However a map is organized, the goal is the same: to highlight the various factors interacting in a system and how they influence each other. If individual interventions or measures aren’t providing the improvements you hoped for, consider improving the interactive systems.

**Section Summary**

- Wellbeing exists within systems that either hinder or enhance your efforts to increase individual wellbeing.
- Wellbeing does not look the same to everyone.
- Your wellbeing goal should not expect constant improvement but emphasize reliable balance and self-efficacy.
- Consider utilizing a systems map.

Wellbeing and Socioeconomic Considerations

Systems can either foster or impede efforts to increase individual wellbeing. For example, low socioeconomic status places individuals in a system correlated to lower levels of psychological health and greater likelihood of mental illness in children (Ge, 2017). The connection between low SES and decreased wellbeing has also been observed in adults (Kaplan, Shema, & Leite, 2008). The interaction between SES and wellbeing highlights the importance of viewing wellbeing on dual continua and as part of a system. Children from low SES backgrounds (systems) face more struggles than their middle class peers. However, by viewing wellbeing on dual continua, educators can help these children realize they have the same potential to thrive as their peers, even as their struggles increase in number or size.

Delving into the relationship between SES and wellbeing, researchers have found that the SES impact on wellbeing may be determined by a single condition: parent involvement. Researchers in China discovered “socioeconomic status does not have a significant effect on well-being when social support is taken into consideration” (Chu, Li, Li, & Han, 2015, p.159). Another study found that with mediation of parent involvement within positive parent and child relationships, socioeconomic status was not significantly related to child wellbeing (Ge, 2017). However, a similar study qualified the generalization:
[Although] parental involvement does act as a valuable source of familial social capital and also operates to reduce the harmful effect of childhood poverty . . . parental involvement was not sufficient to completely cancel the negative association between poverty and education; instead it acted as a “partial” mediator. (Hango, 2005, p.14)

As these studies show, the effects of poverty on child wellbeing can be reduced through parent involvement. Living in a low socioeconomic system does not impact children as much as absence of an active parent in their life. While the research is rather recent, involving parents in the conversation of wellbeing can be helpful in empowering children from low SES backgrounds. Consider how the parents of your students can take part in your school’s program of wellbeing.

**Section Summary**

- Low socioeconomic status is correlated with lower levels of wellbeing, but viewing wellbeing as dual continua means these children can still flourish despite opposition.
- Parent Involvement has the greatest impact on child wellbeing, mediating some of the negative effects of low socioeconomic status. Consider involving parents in your school’s wellbeing efforts.

**Suggestions for Further Research**

A Measure Suited for Your School

Researchers have found no “right way” to measure wellbeing, “The evidence suggests that there is little consistent agreement on how well-being should be measured, how instruments should be designed or which dimensions should be included” (Linton, Dieppe, & Medina-Lara, 2016). Thus you must be the wellbeing expert in your context. You know the students, faculty, and staff whose lives this work will touch. All the advice given must be considered generalizable rather than prescriptive.

Consider the purpose and strengths of each measure. Short measures tend to offer “quick global snapshots of wellbeing,” while longer ones tend to “provide a more comprehensive assessment” (Linton, Dieppe, & Medina-Lara, 2016, p. ). Measures that focus on specific aspects of wellbeing, like gratitude or hope, are “conceptually narrower and, as a result, are better equipped to facilitate more focused assessment” (Linton, Dieppe, & Medina-Lara, 2016, p. ). If you are just beginning to measure wellbeing, a global and general assessment might provide the broad view needed to help orient you to your school’s wellbeing situation. Once you have done this, you may benefit from identifying specific areas that need attention in your context and using a specific measure to assess these areas. For example, if after a short, general assessment you find a specific grade level seems to be struggling, consider talking with the teachers and staff about what they have noticed and what they think may help. If as a team you decide to focus on gratitude, use a gratitude measure to track the effectiveness of
your interventions.

Consider the available resources, such as time, money, and personnel. For example, pressures on time and personnel will necessitate shorter measures. In addition, the length and content factors can result in response burden for participants. Response burden leads to “lower response rates, reduced completion, and reduced data quality” (Rolstad, Adler, & Ryden, 2011, n.p.). Consider the literacy abilities of your population, which may limit which measure you administer, the languages you administer it in, and whether you administer it online or with paper and pen. Consider how often you want to administer the measure: “More frequent measurement will allow more detailed tracking of levels of well-being, picking up on short-term variation in response to particular events and seasons” (NEF, date, p. 15). Consider the consent you will need from parents, students, and staff. For example, asking for parental consent for students to take the survey anonymously may cause difficulty in identifying struggling individuals and implementing specific Tier 2 or Tier 3 interventions on their behalf.

When considering your resources, you must recognize that no measure is truly “free.” There are several necessities that affect the ultimate cost of administering and responding to a survey, including personnel, facilities, equipment, materials, expertise to interpret results, and opportunity cost. If a district doesn’t have the personnel, equipment, or expertise to administer, analyze, and respond to the results of a measure, a “free” measure may end up costing more than you anticipate after paying for the resources and reports. Thus while several measures included in this resource are “free,” you must think critically about the needs and resources of your school to determine the ultimate costs. Paying for a service that can accurately interpret your results could end up actually being cheaper and much more effective.

After considering your resources, focus on what you can control. Start
with small wins to build momentum. You must “avoid undue burden on students or staff” and focus on “the domains which [your school has] the capacity to influence” and “what consequential action might be taken as a result” (EBPU et al., date, p. 9). Be sure that you are prepared to act on what you measure. For example, you may choose to focus on gratitude for your students not only because it will benefit your students, but also because your school is positioned to help in y and z ways. When you have completed these considerations, our intervention resource can help you in deciding what factors of wellbeing you are prepared to improve with targeted interventions.

Finally, consider ways to measure wellbeing outside of the tools listed here. For example, qualitative measures such as interviews, focus groups, or narratives can help fill in missing pieces of information (Renata, 2019). After taking a general census sample, consider disaggregating the data to look at similarities across demographics and populations. Disaggregating data can help you make the most of each survey as you look for significant differences involving genders, races, ethnicities, grade levels, and socio-economic status (National Center, 2012). Consider using multiple measures and triangulating the results to better pinpoint your school’s strengths (betterevaluation, DATE). These tools will help you get as much information about your school’s wellbeing as possible so that your decisions are informed by accurate data and information.
Section Summary

- There is no one right way to measure wellbeing. Use what you know about your context to inform your choice.
- Consider the purpose of each measure. Your resources will affect how often you measure and whether you decide to survey students and staff anonymously.
- Each measure should be focused on an aspect of wellbeing that you can influence through interventions. Be prepared to act on what you learn.
- Consider using qualitative as well as quantitative measures, disaggregating your data and triangulating results from multiple measures to get as much information as possible.

National Center for Mental Health Promotion and Youth Violence Prevention. (2012). National Center Brief: The Importance of Disaggregating Student Data (pp. 1–5).

Ethical Considerations

Before beginning to measure wellbeing, consider the ethical principles that govern your work. For example, it is important to get parental consent and child assent. Researchers abide by the practice of “consent trumps assent . . . refusal trumps acceptance” (Felzmann, 2009, pp.104-105). Even if a child assents to participating in research, their parent’s lack of consent prevents the child’s participation. Similarly, a child who does not want to participate does not need to, even if their parent has given permission. Thus both a parent’s and the child’s cooperation are required to include a child in research. These principles can guide you as to the importance of obtaining such clearance.

Remember that administering a survey is a type of intervention that may unearth some difficult emotions in students and staff. Rusk observed, “There needs to be appropriate channels of psychological support in place for respondents. I have seen first hand that getting adults and children to complete wellbeing questionnaires can get them thinking and raise some unpleasant emotions” (personal communication, September 4, 2019). Prepare to offer psychological support to students who face difficult emotions involved with the measure you use. School counselors, psychologists, and parents can be valuable in mediating such difficulties.

In addition to involving parents, consider engaging district level and community level stakeholders as part of your wellbeing team. Not only can they help you note additional ethical concerns, but their involvement can help the process move forward in ways that are best
for the school and community. For example, community members and district level educators can help you consider relevant political and cultural factors in your area. As you carefully read through each item of the survey, their added perspective can help ensure that none of statements could be offensive to any of the cultures in your area.

Finally, be sure to comply with all FERPA and legal regulations. Be intentional about how and with whom you share wellbeing scores. As mentioned in the Wellbeing from a Growth Mindset section, wellbeing scores should never be treated as academic scores: they should not be used to compare schools or rank students. Share scores only when doing so is in the child’s best interest, complies with regulations, and has the potential to help inform future wellbeing interventions.

Section Summary

- Gather and value parental and child consent.
- As administering a survey is a type of intervention, be prepared to offer emotional support.
- Engage community and district leaders as part of your wellbeing team. Ensure there are no items on your survey(s) that could be offensive to groups or cultures in your community.
- Comply with all FERPA and legal regulations. Be intentional and thoughtful about how you use wellbeing scores. Incorrect use can damage wellbeing and break trust.

Suggestions for Further Research

Written in the survey’s description or in the resources linked below is the information on how to get permission to use each survey. You may notice that the surveys with online scoring and special training require fees. However, many surveys have been placed in the public domain or have been licensed for noncommercial/educational use. You are free to use these in your schools. You are not required to contact the author, but you may want to do so to request ideas for implementation and analysis. Authors tend to be interested in the impacts of their work, and your use is a notable impact. Below is a short form letter you can use to start the conversation.

**Form Letter**

Dear ________

I am a/the (position) at (school). I recently came across your work related to wellbeing and your survey, which I understand is (in public domain/licensed for educational use). I would appreciate any advice you have on implementing this survey and analyzing its results. My team and I plan to administer this test to our (population number and type) over a period of (duration of use) in hopes of measuring (objective). We welcome any thoughts and insights you are willing to share regarding the use of your resource.

Thank you,

(Name)
Whether you use this form letter or write your own, be sure to identify who you are and indicate the material you want to use, as well as indicating how, where, and for how long you plan use it (Copyrightlaws.com, date). Be sure to be clear, concise, and specific. More examples can be found through the links on Copyrightlaws.com (see reference below).

Section Summary

- More information on how to get proper access to a measure can be found in each survey’s written description and resources.
- For surveys in the public domain, permission from the author or copyright holder is not required. However, corresponding with the author enables you to ask for advice on how to administer or interpret a particular survey.
- When contacting the author/owner, be sure to identify who you are and what material you want to use, in addition to where, how, and for how long you plan to use it.

Suggestions for Further Research

Implementation

Kern, in an interview with McQuaid, concerned with guiding principles for embedding positive education in schools, remarked, “I wouldn’t say there are specific steps to take but rather key principles and processes to consider” (McQuaid, n.d.). One of the first principles Kern mentioned was that leaders should become familiar with the science of wellbeing. Being familiar with the science, not just the interventions, can help you avoid the trap of “learning just enough positive psychology to be dangerous” (McQuaid). Knowing the science can enable you to direct your efforts so they yield long-lasting change.

Kern recommended leaders involve staff early and often to create shared ownership (McQuaid, n.d.). Driving the wellbeing conversation alone puts a heavy load on a single leader: Change is slower, and wellbeing initiatives are more likely to end when the leader leaves. Consider creating a school leadership team to help facilitate the change process: “As principals strategically leverage ratios and build leaders around them, their energies and efforts will be distributed, multiplied, and improved throughout the school” (Jensen, Boren, & Murphy, 2019). Your school leadership team should include teachers, as they are closest to the students affected by your decisions. Choose teachers who are influential with their colleagues, embrace the school vision, champion your key processes, and think systematically about school needs (Jensen, Boren & Murphy, 2019).

Like wellbeing initiatives, a school’s wellbeing vision should not be driven solely by the principal. A vision co-created with stakeholders, with ownership, not merely buy-in, can survive despite any one leader
or individual leaving. As part of creating ownership, give those on
your teams meaningful assignments, and make sure there is equality
in your meetings (Jensen, Boren & Murphey).

A teacher who isn’t on your leadership team can be engaged as a
wellbeing advocate. Shawn Achor’s (2018) research affirmed the
importance of creating wellbeing advocates from every seat. He
observed, “When we are brave enough to expand power to others,
suddenly we find that a huge weight is lifted off our shoulders,
increasing our power to lift even heavier loads” (p. 114). You may
invite classroom teachers to educate parents about why schools need
to foster wellbeing. With parents and teachers engaged, your efforts
are more likely to reach every child and to continue. You can
accomplish more for your school’s wellbeing as you empower more
people to help you in the change process. Allow your enthusiasm to be
infectious. Create ownership and empower your faculty, students, and
staff to become wellbeing leaders who can share your load and
strengthen your efforts.

After enlisting your teams and wellbeing advocates, create a shared
vocabulary and vision. Rachel Powell, a business professional and
specialist in applied positive psychology advises organizations to
begin their efforts at promoting wellbeing by creating a common
language. In her organization, Xero, she created a leadership team
that worked together to define wellbeing according to their values.
This common language helped unite stakeholders with their wellbeing
efforts (Powell & McQuaid, date). Similarly, Richard DuFour (2016),
an educational researcher specializing in professional learning
communities, commented,

It is difficult enough to bring these concepts to life in a school or
district when there is a shared understanding of their meaning. It is
impossible when there is not common understanding and the terms
mean very different things to different people within the same
organization (p. 19).
After gathering your wellbeing team, come to a consensus about what wellbeing looks like in your setting. Create a common language based on your values and research-based evidence. Consider using some of the principles of appreciative inquiry as you create your language and goals. Then, use this language often with your teachers, students, and staff. Not only will doing so help unify your efforts, it will also help empower your wellbeing advocates to be a more active part of your clarified purpose.

**Section Summary**

- Create buy-in and recruit wellbeing leaders from throughout your school.
- Create a common language to unify your definition and vision of wellbeing.

**Suggestions for Further Research**

As you use the data collected with these measures to leverage individual and school growth and capacity, consider the following approaches.

**Appreciative Inquiry**

Consider integrating appreciative inquiry and a strengths-based perspective into your professional learning communities or your traditional multi-tiered response to intervention (RTI). Appreciative inquiry, created and popularized by Cooperrider, is a strengths-based approach to change (Center for Appreciative Inquiry, date), aligned with the main tenant of positive psychology through its focus on the positive. Rather than focusing on fixing problems and attacking weaknesses with a deficit mindset, appreciative Inquiry seeks to capitalize on existing strengths. Research by Achor (2018) supports the neurological power that results from focusing on the positive:

Too many managers highlight the point of weakness or areas for improvement first, before highlighting the positive. From the perspective of the brain, this tells the employee that the manager cares not about their strengths but their weaknesses; not their growth but their deficits. Thus the brain believes that their positive behaviors do not matter. And what does not matter does not get repeated. (p. 127).
Attention directs brain focus and shapes behavior. For example, focusing on “not being upset,” causes the brain to attend to the negative emotions being avoided rather than positive emotions that may replace them. Consequently, we may miss opportunities to foster positive emotions if we are too focused on avoiding the negative. This principle of brain focus is one of the reasons why appreciative inquiry has been found to increase buy-in; enable creativity; improve business efficiency and output; revitalize commitment, enthusiasm, and engagement; and “work across all types of organizational sectors, from for-profit to the social sector” (Champlain College, n.d., n.p.).

Appreciative Inquiry consists of five D’s: definition, discovery, dream, design, and destiny. First, inquirers define the strength or positive focus of their investigation. Then they discover particular moments that have involved these strengths and share them with others to define the life-giving forces. Life-giving forces are “elements or experiences within the organization’s past and/or present that represent the organization’s strengths when it is operating at its very best” (Center for Appreciative Inquiry, 2016, n.p.). Next coworkers envision, or dream, the future they want to create by capitalizing on these strengths, design that future into reality, and reevaluate how accurately their design leads them to their envisioned destiny (The Center for Appreciative Inquiry, 2016). A similar appreciative inquiry-based model, SOAR, focuses on strengths by asking particular questions: “What are our greatest strengths? What are our best opportunities? What is our preferred future [or aspirations]? What are the measurable results that will tell us we’ve achieved that vision of the future?” (emphasis added; ASO, 2016). It is important to note that in appreciative inquiry and SOAR models, problems are reframed, not ignored.

Focusing on the positive can help energize you, your educators, and your students to reframe problems, create positive change, and increase wellbeing. For example, a principal using an appreciative inquiry approach would focus on the school’s high levels of
engagement, rather than on the low levels of positive emotion. Teachers and school leaders would gather to discuss moments when they have noticed engagement in their students. This strengths-focused discussion would help energize and prepare them to discuss needed changes. After teachers and school leaders had shared these stories with each other, they would begin to design and implement interventions to help their students become even more engaged. The low levels of positive emotion in their students’ experiences wouldn’t be ignored, but would be reframed as opportunities for growth. Teachers and school leaders would also discuss times when they had observed their students expressing positive emotions, identify the life-giving moments that enabled these positive emotions, and seek ways to foster more of these experiences.

**Response to Intervention**

Positive psychology and response to intervention (RTI) can be complementary as you endeavor to increase the wellbeing of all your students. The general measures you administer should be “reviewed on a regular basis and in a systematic manner” (Sugia, date, page no), allowing you to notice patterns of wellbeing changes over time, keep track of improvements, and quickly respond to information. For example, you may notice overall decreases in wellbeing towards the end of terms for teachers and students. Recognizing this pattern can help you take proactive and preventive action to improve future end of terms. However, be aware the measuring wellbeing too often can lead to response bias.

In order to do any Tier 2 interventions, you will need to identify struggling students. One way to do this is to identify students on their surveys rather than administering the surveys anonymously. However, removing anonymity may have some unintended ethical and response consequences and thus may require obtaining different kinds of permissions. See the section Ethical Considerations and Wellbeing.
from a Growth Mindset for more information. Tier 2 interventions involving wellbeing could include administering an additional, more detailed, survey to better understand the situation or applying a more specialized intervention.

Administering measures is not the only way to identify students who could benefit from a Tier 2 intervention. As in most studies involving human subjects, numbers often don’t tell the complete or perfectly accurate story. Just as academic assessments can have a margin of error, so can wellbeing measures. So trust your observations. If your teachers seem to be struggling with hope, try a researched-backed hope-based intervention. If the misbehavior of a class of students seems to be due to poor engagement, try a research-backed engagement intervention. As the wellbeing expert in your context, learning to rely on your observations to note patterns and trends can help you intervene in appropriate ways.

**Section Summary**

- Appreciative inquiry and the Soar model consider strengths, rather than adopting a deficit mindset, to energize change. Instead of ignoring or focusing on weaknesses, you can reframe them to focus on what you want for your school.
- Strengths-based approaches increase buy-in, promote creativity, and lead to other positive results. These methods more readily focuses the brain’s attention towards a positive goal.
- Consider integrating a strengths-based approach into your PLCs or into a multi-tiered response to intervention model.

Measuring gratitude in children is difficult, as many researchers believe that gratitude isn’t fully developed until a child is 7 to 10 years old depending on environmental and individual factors (Froh et al., 2011). However, gratitude is linked to positive emotions, healthy functioning, and adaptive social behaviors. In addition, measuring gratitude, life satisfaction, and hope can provide a unique chronoperspective on wellbeing. Gratitude focuses on past wellbeing, life satisfaction deals with current wellbeing, and hope refers to wellbeing directed at the future. For these reasons, gratitude should be considered as a relevant facet of wellbeing.

Researchers have looked at three adult gratitude measures and considered their efficacy with children: the Gratitude Questionnaire-6 (GQ-6), the Gratitude Adjective Checklist (GAC), and the Gratitude...
Resentment and Appreciation Test (GRAT). Their research provided “preliminary support . . . for the use of the GQ-6, GAC, and GRAT-short form with 14- to 19-year-olds, with one small exception: The GAC demonstrated lower correlations with NA in this study” (Froh et al., 2011, p. 320). They recommended that researchers exclude Item 6 when using the GQ-6 with youth. The GRAT short-form should not be used with 10-13-year-olds. The GQ-6 has 6 items, the GAC has 3 items, and the GRAT has 44 or 16 items depending on form. All scales are rated on a Likert scale and require the proper permission and citation for use.

Warwick-Edinburgh Mental Well-being scale (WEMWBS)

This wellbeing scale has been used on local and national levels. Countries such as England, Scotland, and Iceland have used it to measure national wellbeing. It contains “a 14 item scale with 5 response categories, summed to provide a single score ranging from 14-70. The items are all worded positively and cover both feeling and functioning aspects of mental wellbeing” (Warwick-Edinburgh Mental Wellbeing, 2015, n.p.). This scale is available in Dutch, French, German, Greek, Italian, Japanese, Spanish, Brazilian, and a variety of other languages. The Shorter Warwick-Edinburgh Mental Wellbeing Scale (SWEMWBS) is a more concise 7-item version. Both scales strictly focus on wellbeing and cannot be used to assess mental illness in students. Non-commercial use of this scale requires registration;
commercial organizations should contact Isla Millar at ventures@warwick.ac.uk.

Positive and Negative Affect Schedule for Children (PANAS-C)

This assessment, similar to the Positive and Negative Affect Schedule (PANAS) for adults, is a valid and reliable tool to assess the frequency of positive and negative emotions in children. While it is often used to assess anxiety and depression in youth, it can also be used to assess the positive emotions that contribute to wellbeing. The PANAS-C consists of 29 self-report questions children can respond to on a 5-point Likert scale according to the frequency they experienced each emotion during the past week. There is a shortened 10-item version of this schedule which is similar in validity and is more efficient to administer.

The EPOCH Measure of Adolescent Well-being follows the EPOCH definition of wellbeing as an amalgam of five: engagement, perseverance, optimism, connectedness, and happiness. Students complete this 20-item survey by responding on a 5-point Likert scale to statements such as “I feel happy . . . In uncertain times, I expect the best . . . I am a hard worker” (Kern). This measurement has been tested with adolescents of different socioeconomic situations across Australia and the United States, including juvenile offenders, students, and patients in hospitals. It requires a citation for any publication, and completion of a registration form on Kern’s website (linked below) for use.

Six Seconds Youth Version (SEI-YV)

The Six Seconds Youth Version measure comes highly recommended by CASEL (The Collaborative for Academic, Social, and Emotional Learning). It assesses 37 different aspects of social and emotional learning ranging from health, resilience, self-efficacy, life satisfaction, commitment, and connection, to collaboration. For a complete list, refer to the further research section below (Access, 2018).

Appropriate for 2nd to 12th graders, it contains 99 questions on a 5-point Likert scale from *almost never* to *almost always*, with four open response questions; it can be completed in about 15 to 20 minutes. The open response questions ask students to complete sentences like “Emotional intelligence is important because . . . Emotional intelligence is . . . .” It also has a designated place for students to
leave further comments. It is available in English, Spanish, Chinese, Italian, Arabic, and Lithuanian. The Six Seconds Youth Measure is scored by a computer that uses “an algorithm which standardizes the measures using validated international norms” (Access, 2018). Administering this tool requires a certification obtained through courses which require an admissions fee; also there is a five dollar cost per student. Six Seconds offers a few grants to cover the costs of this tool.

Children’s Hope Scale

This hope scale measures children’s hope through their perceptions of their ability to reach their goals, as “children are goal directed and . . . their goal-related thoughts can be understood according to two components: agency and pathways” (Snyder et al., 1997, p. 400). Agency is the ability to work towards a goal, and pathways indicates the capacity to find a way towards the goal. The Children’s Hope Scale has six items on a 6-point Likert scale and is suitable for children ages 8 to 16. It is free and requires only the proper citations to use. It is reliable and valid, having been extensively tested in schools (Snyder et al., 1997).

Assessing Wellbeing in Schools 69
Suggestions for Further Research

The Multidimensional Students’ Life Satisfaction Scale is an extended version of the Students’ Life Satisfaction scale mentioned above. It focuses on life satisfaction, but unlike its predecessor it divides satisfaction into different domains: family, friends, school, living environment, and self. The long form of this measurement contains 40 items on a 6-point scale; the brief form has six items. This measurement is free and requires only the proper citation for use. It is appropriate for 8 to 18 year olds.

CORC. (n.d.). Multidimensional Student's Life Satisfaction Scale (MSLSS). [https://edtechbooks.org/-qHa](https://edtechbooks.org/-qHa)

The Students' Life Satisfaction Scale measures students’ satisfaction with life independently from other domains. The SLSS includes seven self-report statements which students answer on a 6-point scale from strongly disagree to strongly agree. It’s designed specifically for students 8 to 18 years old. This measurement tool is free for school use and requires only a citation for use in any publication. A study of over 600 third to sixth graders found that “the SLSS does not appear to display differential psychometric properties as a function of a child’s race, at least with respect to black and white elementary school age children” (Huebner, 1995, pp. 320-321). Similarly, “satisfaction scores did not differ as a function of age, grade, or gender,” which further supports this tool’s reliability (Huebner,

The Stirling Children's Well-being Scale (SCWBS)

This wellbeing scale was designed by the Stirling Council of Educational Psychology Service, in the United Kingdom, to assess wellbeing in students Ages 8 to 15. The scale presents 12 positive statements that students rank on a 5-point Likert scale based on the frequency that the statement applies in their life. It has been tested in over 18 schools, and an adapted version has been used in Bangladesh. It is positively worded and focuses on psychological and emotional wellbeing.

Assessing Wellbeing in Schools
Suggestions for Further Research

The Me and My Feelings survey is appropriate for elementary students as young as Age 8. Its 16 self-report questions address wellbeing through two domains: emotional and behavioral difficulties. Students reply on a 3-point Likert scale (never, sometimes, always) according to the frequency they relate to statements such as “I feel lonely . . . I get very angry . . . I am calm . . . I worry when I am at school” (Wellbeing Measurement). This survey is reliable, valid, and sensitive to change. It requires citing for use in publications and contact (EBPU@annafreud.org) before use (Wellbeing Measurement).

Me and My School Questionnaire (M&MS)

Me and My School Questionnaire is designed to assess emotional and behavioral difficulties in students Ages 8 and older. Its 16 items were specifically designed “so that younger children could easily read and comprehend [them]” (Moffa et al., 2019, p.3). Statements such as “I feel lonely” are rated on a Likert scale (EEF). The questionnaire has been tested in schools across the United States and the UK.

*Education Endowment Foundation*, [https://edtechbooks.org/-gzK](https://edtechbooks.org/-gzK).

Created by Tyler Renshaw, the Student Subjective Wellbeing Questionnaire provides a holistic view of wellbeing across four domains: joy of learning, school connectedness, education purpose, and academic efficacy. The questionnaire consists of 16 positively stated items that students rank on a 4-point Likert scale, representing the frequency that statement is true in their life. It is appropriate for students Ages 11-14. Renshaw has also created a Teacher Subjective Wellbeing Questionnaire which can be used in conjunction with this survey for greater continuity across populations.

For more information about Dr. Renshaw's work, visit his website which can be found here.

Student Subjective Wellbeing Questionnaire: Measures database. (n.d.). Retrieved from [https://edtechbooks.org/-sIq](https://edtechbooks.org/-sIq)
Since its creation in 1993, The Psychological Sense of School Membership has been widely used to measure students’ sense of belonging at school. An adapted version of this measure, specifically modified to be developmentally appropriate for younger students, is the focus of this section. This version has 18 items appropriate for students Age 8 and older. Rather than statements, the items are in the form of questions: For example, “‘Are teachers interested in students like you?’ (Wagle et al., 2018, p. 574). Students rank each question on a 6-point Likert scale ranging from yes to no. This version has been tested with over 2,500 students in the United States, United Kingdom,
and China.

Social Emotional Health Survey-Primary (SEHS-P)

The SEHS-P has 20 items that measure gratitude, optimism, zest, persistence, and prosocial behavior (Project CoVitality). This survey is appropriate for students in Grades 5-8 and possibly younger. Students respond to each item on a 4-point Likert scale: for example, “I am lucky to go to my school” (Furlong). It is reliable and valid. A version is available specifically for secondary students. This survey can be administered through Mosaic Network Inc.’s CoVitality Screener. Though it requires a substantial purchase, this app allows students to take the survey online and receive results in real time. The screener compiles their responses into an intuitive report that facilitating insights on individual and group wellbeing (see image to the right). All data are secure and comply with HIPAA and FERPA. It
also includes additional scales, making it optimal for universal screenings for school well being. To review the SEHS-P, click here.

### Pros for Schools
- 20 items
- Comprehensive view of wellbeing
- Widely tested
- Secondary form allowing for continuity across grades (SEHS-S)
- Associated Covitality App available through Mosaic Network Inc. (Includes fee)

### Cons for Schools
- The CoVitality Screener typically costs $500 (set up with custom configuration and training fee) and $1.25 per student

Images in this sections are used with permission by Mosaic Network Inc.

The School Attitude Questionnaire assesses students’ attitudes towards school for the domains of “Belongingness to School, School Image, Loneliness at School, Teaching, Testing and Feedback-Giving Activities, and Reluctance” (Seker, 2011, p.241). Each of the 22 items is a statement specifically related to one of these domains. Responses are measured on a 5-point Likert scale from strongly agree to strongly disagree. The questionnaire’s reliability and validity were assessed using a sample of 362 elementary students from 11 to 13 years old. Findings asserted that “there were significant correlations between students’ school attitude scores and related factors” (Seker, 2011, p.249). However, this study noted that The School Attitude Questionnaire “can be used widely and not just within the population.
tested in this study” (Seker, 2011, p.255). This questionnaire requires citing properly as well as contacting the author for permission.

**Suggestions for Further Research**

The PedsQL assesses wellbeing from a clinical perspective across four domains: physical, emotional, social, and school functioning. It includes a model for children Ages 2 to 18 and a separate parent proxy report. It is reliable and valid, and it is responsive to clinical changes over time. It contains 23 items rated on a 0-4 Likert scale by the frequency each statement accurately describes the child’s life. The PedsQL can be completed in about 4 minutes. It has been previously used in a sleep and wellbeing intervention for elementary students (Quach, 2011). This questionnaire has been translated into multiple languages, including broadcast Spanish. It is free for non-academic use, which would probably include most school leaders (ePROVIDE, 2019).
### Pros for Schools

- Proxy report option
- Valid and reliable
- Appropriate for Ages 2-18
- Available in multiple languages
- Short (23 items/4 items)
- No cost

### Cons for Schools

- Some translations lack "full linguistic validation process" (ePROVIDE, 2019)

### Suggestions for Further Research

ePROVIDE. (2019, October). Pediatric Quality of Life Inventory™ (PedsQL™). [https://edtechbooks.org/-Dke](https://edtechbooks.org/-Dke)

The SEHS-S assesses 12 subscales across four traits: belief-in-self, belief-in others, emotional competence, and engaged living. These 12 subscales include emotional regulation, empathy, self-control, self-efficacy, persistence, self-awareness, optimism, zest, gratitude, family coherence, peer support and school support. It is appropriate for students in Grades 7 to 12. The SEHS-S has 36 self-report items on a 4-point Likert scale: For example, “When I try to solve a math problem, I will not stop until I find a solution,” and “I have a friend my age who really cares about me” (Project CoVitality). This survey has been widely tested across the United States, Australia, Korea, and Japan.
This survey can be administered through Mosaic Network Inc.’s CoVitality Screener. Purchasing this app allows students to take the survey online with results available in real time. The screener compiles students’ responses into an intuitive report providing insights into individual and group wellbeing (see image to the right). All data are secure and comply with HIPAA and FERPA. Additional scales make this instrument optimal for universal screenings for school wellbeing.
### Pros for Schools
- Widely tested
- Comprehensive view of wellbeing
- Measures subscales across several traits
- Primary form enables continuity across grades (SEHS-P)
- Associated Covitality App available through Mosaic Network Inc. (requires fee)

### Cons for Schools
- Covitality Screener typical cost of $500 for set up with custom configuration and training fee, plus $1.25 per student

Images in this sections are used with permission by Mosaic Network Inc.

The Student Resilience Survey (SRS)

The Student Resilience Survey is recommended by the Child Outcomes Research Consortium, an organization in the United Kingdom dedicated to assessing wellbeing. This survey is part of a packet of various resources available to gather information about the whole child, not just the child’s academic performance (Wellbeing Measurement Framework). Its 47 self-report questions, answered on a 5-point Likert scale, are appropriate for any child 7 years or older.

This tool focuses on wellbeing and resilience across 12 subscales: “Communication and cooperation, self-esteem, empathy, problem solving, goals and aspirations, family connection, school connection, community connection, autonomy experience, pro-social peers,
meaningful participation in community activity and peer support” (CORC). A study involving 7,663 children across England recorded that “results supported the construct validity of the 10 factors of the scale and provided evidence for acceptable reliability of all the subscales” and that “correlations showed that all the student resilience subscales were negatively associated with mental health difficulties, global subjective distress and impact on health . . . [also that] family connection, self-esteem, problem solving and peer support were negatively associated with all the mental health outcomes” (Lereya et al., 2016). The SRS requires only a citation for use.

Holistic Student Assessment (HSA)

This assessment was developed at The PEAR Institute: Partnerships in Education and Resilience at McLean Hospital and Harvard Medical School. Based on The PEAR Institute’s Clover Model, a developmental process theory by PEAR Director Gil Noam, this assessment focuses on the balance between active engagement, assertiveness, belonging, and reflection. Consistent with these categories, the HSA is a youth self-report survey that assesses students’ social emotional strengths and challenges across three domains: resiliencies (action orientation, emotional control, assertiveness, trust, empathy, reflection, and optimism); relationships (relationships with peers, relationships with adults); and learning and school engagement (learning interest, critical thinking, perseverance, academic motivation, and school
bonding). With this coverage the HSA provides an extensive overview of the student’s social and emotional development.

The HSA has both a long and a short version. The long version, consisting of 61 items (measuring scales from all three domains (resiliencies, relationships, and learning and school engagement) requires 20 minutes administration time. The short version, HSA Core, consists of 30 items (measuring only the resiliency domain) and can be administered in 10 minutes. Both versions are reliable and valid. For more specific information on its reliability and validity, RAND lists several studies which detail their specific findings. The HSA is appropriate for Grades 3-12 and is available in 14 different languages. A per-student survey fee is required for use, and “cost of survey implementation depends on number of participants and
wraparound training services requested by the school or program” (Access Assessment Guide). Scores are analyzed by The PEAR Institute and are returned within one week as online access to a secure, dynamic data dashboard containing individual student portraits and an aggregate dashboard for school, program, or school district. “Scores are compared to national norms by age and gender for youth ages 9 to 18” (Access Assessment Guide). The images to the right are a sample portrait and dashboard.

Flourishing at School Survey (FAS)

This survey is a cloud-based software system, part of a full set of resources published by Flourishing at School. The FAS defines flourishing by domains similar to the common Perma construct: which includes positive emotions, engagement, positive relationships, meaningfulness, and accomplishment, as well as physical health measures like exercise, sleep, and nutrition.
The newly released 2.0 version, which is integrated with VIA character strengths, contains 62 multiple-choice questions and can be completed in approximately 30 minutes. Results are compared to a large normative sample. A student and staff module can allow greater continuity between populations. The validity of this assessment was established “in collaboration with researchers from Murdoch University (Perth, Western Australia) in two studies comprising a total of 15 Australian secondary schools and more than 7,500 students” (Assessment Manual). The $2,500 base rate includes 50 faculty accounts; $50 is charged for each additional account and $5 for every student account. This annual subscription “allows for the unlimited use of the included surveys (VIA and Flourish for Students, plus VIA, Flourish and Work Design surveys for faculty)” (J. Schie, personal communication, November 5, 2019). The results are interpreted and
returned as a dynamic dashboard (see example below).

Subjective Happiness Scale (SHS)

The SHS, which assesses self-perceptions of happiness, had its reliability and validity proven in 14 studies of adults, college students, and high school students (Lyubomirsky & Lepper, 1999, p. 137). This measure is based on the theoretical Happiness Pie Equation that attributes half of your potential happiness to your genes, ten percents to your life circumstances, and forty percent to your choices (Lyubomirsky, 2018). It consists of four self-report questions. This theoretical equation for wellbeing has come under recent criticism for its research sources and its accuracy in allocating only 10% of happiness to result from life circumstances. Current research shows the percentage may be higher and may vary greatly depending on the individual. Similarly, this model has been criticized for being overly
simplified (McQuaid, Brown, & Rohrer, 2018). However, how this criticism impacts the survey is still unknown.

Lyubomirsky, S. (2020). Subjective Happiness Scale (SHS). [https://edtechbooks.org/-QgR](https://edtechbooks.org/-QgR)

The SWL measures self-perceptions of individual life satisfaction, correlated with mental health, subjective quality of life, and likelihood to attempt suicide. Individuals respond to five items a 7-point Likert scale. It has been used in studies of emotional regulation in several schools (Quoidbach et al., 2010. This test has high internal consistency and test-retest correlations (Pavot & Diener, 2008). It is available in multiple languages. The article “Well-being Assessment: An Evaluation of Well-being Scales for Public Health and Population Estimates of Well-being Among US Adults” compares it to national norms, providing several charts with the mean scores across demographic groups to help individuals contextualize their wellbeing scores. For example, figures show that
men Ages 18-24 have a mean score of 3.5. Thus an individual in this demographic with a score of 3.8 would be lightly above average. The website [https://eddiener.com/](https://eddiener.com/) includes more information and articles on this and other scales.

“The scale is copyrighted but you are free to use it without permission or charge by all professionals (researchers and practitioners) as long as you give credit to the authors of the scale: Ed Diener, Robert A. Emmons, Randy J. Larsen and Sharon Griffin as noted in the 1985 article in the *Journal of Personality Assessment*” ([eddiener.com](https://eddiener.com)).

Suggestions for Further Research

Flourishing Scale (FS)

The Flourishing Scale measures wellbeing by the PERMA model, modified to include self-esteem, purpose, and optimism. This scale contains eight items. It is reliable and valid and has been shown to be appropriate for any adult. If it is used in any publication, proper citation is required. We recommend visiting Ed Diener’s website for information and articles on this and other scales.

### Pros for Schools
- Free
- Valid and reliable
- Translations available

### Cons for Schools
- Possibly too short for robust understanding (8-items)
- Not specific to workplaces
Suggestions for Further Research

The Oxford Happiness Questionnaire (OHQ)

The Oxford Happiness Questionnaire, designed to measure individual happiness, is based on the Oxford Happiness Inventory (OHI). The OHQ is valid and reliable; researchers found “a battery of personality variables known to be associated with well-being [that] were stronger for OHQ than for the OHI” (Hills & Argyle, 2001, p. 1073). This questionnaire has 29 self-report statements for responses on a 6-point Likert scale. A shortened 8-item version is also available. The OHQ has been used in several studies including a study of mindfulness and wellbeing (St-Louis et al., 2018).
## Pros for Schools

- 29 questions
- Shortened 8-item version available
- Widely used

## Cons for Schools

## Suggestions for Further Research

Comprehensive and Brief Inventory of Thriving (CIT & BIT)

Two purposes have been stated for the Inventory of Thriving:“(1) to measure a broad range of psychological well-being constructs and represent a holistic view of positive functioning; and (2) to predict important health outcomes . . . useful for researchers and health practitioners” (Diener, n.d., n.p.). The comprehensive version has 54 items divided over seven domains which cover 18 subscales: Relationship (support, community, trust, respect, loneliness, belonging), Engagement, Mastery (skills, learning, accomplishment, self-efficacy, self-worth), Autonomy (control), Meaning (meaning and purpose), Optimism, Subjective Well-Being (life satisfaction, positive
feelings, negative feelings). The brief version has 10 items. Multiple translations are available. There is no charge for all noncommercial uses as long as appropriate credit is given to authors (see citation below). We recommend visiting Diener’s website for information and articles on this and other scales.

Mental Health Continuum Short and Long Form (MHC-SF)

This instrument measures emotional, social, and psychological wellbeing via 14 items that participants respond to on a 6-point Likert scale from never to every day. Items are summed for a total score out of 70, with higher scores indicating greater wellbeing. It is available in French, Korean, Chinese, Japanese, Dutch, Norwegian, Swedish, and Finnish, with more translations coming as researchers continue to translate it for their use. It has been used in hundreds of studies over the two decades since its creation. There is also a longer form with 40 items.
### Pros for Schools

- Multiple translations available
- Although used primarily with adults, also useful for 12-18-year-olds
- Extensive overview of wellbeing for = relatively few items
- Long and short forms available

### Cons for Schools

### Suggestions for Further Research

Lee Kum Sheung Center for Health and Happiness. Mental Health Continuum Short Form. [https://edtechbooks.org/-DqM](https://edtechbooks.org/-DqM)
The PANAS measures wellbeing through two mood scales: one measuring positive affect (emotions) and the other measuring negative affect. Participants respond to its 20 items on a 5-point Likert scale according to how often they have experienced specific emotions over the past week. The PANAS has moderately good reliability and validity (Watson, 1988), and it has been used in a variety of dissertations and articles (statistics solutions). Available in French, German, and Swedish as well as English, it can be used with no cost without the necessity of contacting the American Psychological Association Permissions Office for non-profit research purposes (Mapi Research Trust).
### Pros for Schools
- Has a partner scale for children (see PANAS-C)
- Multiple translations available

### Cons for Schools

### Suggestions for Further Research

Positive and Negative Affect Schedule (PANAS). (n.d.). Retrieved from [https://edtechbooks.org/-yttt](https://edtechbooks.org/-yttt)

The PERMA profiler is designed to measure the general wellbeing of adults according to Seligman’s PERMA model. This questionnaire measures positive and negative emotions, engagement, relationships, meaning, accomplishment, and health. Participants respond to 23 items on a 10-point Likert scale: For example, “In general, how often do you feel joyful? . . . How often do you lose track of time while doing something you enjoy?” (Kern, n.d., n.p.). This measure is free for any noncommercial use as long as the appropriate credits are given, but administrators are requested to read through the PERMA Profiler document and register before using the measure. Participants can take the PERMA profiler online by registering at https://edtechbooks.org/-kQI.

Teacher Subjective Wellbeing Questionnaire (TSWQ)

The TSWQ measures teacher wellbeing across two subscales: school connectedness and teaching efficacy. The subscales can be used independently or combined to create an overall wellbeing score. Teachers rank eight positive statements on an 8-point Likert scale representing frequency the statement is true in their life: For example, “I am a successful teacher” or “I feel like people at this school care about me” (Measure and User Guide, n.d., n.p.). Tyler Renshaw’s Student Subjective Wellbeing Questionnaire can be used with this questionnaire for greater continuity across populations. For more information about Renshaw’s work, visit his website here.
Assessing Wellbeing in Schools

Pros for Schools
Short holistic overview of wellbeing
Use with Renshaw's Student Subjective Wellbeing Questionnaire to enable greater continuity across populations

Cons for Schools
Few, if any, available translations

Suggestions for Further Research

Similar to the Job Satisfaction Survey (JSS), the Job-related Affective Well-being Scale (JAWS) solely focuses on the work domain of wellbeing. It assesses the emotional reactions people feel towards their work. It has 30 questions, one for each emotion, and asks participants to rate how often they have experienced that emotion on a 5 point likert scale. There is a shortened 20 item version as well, which Dr. Spector more frequently uses in his research. Both versions have been translated into multiple versions. It is free to use for educational and noncommercial purposes as long as you share the results and any translations you create with Dr. Spector at pspector@usf.edu.
### Pros for Schools
- Multiple translations
- Widely used outside the field of education

### Cons for Schools
- Only measures one domain of wellbeing

#### Suggestion for Further Research

The Workplace PERMA-Profiler is designed to assess wellbeing according to Seligman’s PERMA model, which includes “Five core element[s] [related to] psychological well-being and happiness” (Pascha, date, page no.). These elements are positive emotions (feeling good), engagement (finding flow), relationships (authentic connections), meaning (purposeful existence), and achievement (sense of accomplishment). The survey also takes into account the importance of health and the frequency of negative emotions. Participants respond to 23 self-report questions on a 10-point Likert scale from not at all to completely. To use this profiler without charge requires completion of a wellbeing measures registration form found at www.peggykern.org/questionaires.html.

The Gallup Q12 Employee Engagement Questionnaire

This Questionnaire was designed by Gallup researchers to help employers assess their employees' level of engagement. As indicated by the PERMA model (Seligman, date), engagement is a primary factor in an individual’s overall wellbeing. Research has found employee engagement, as measured by this survey, leads to less turnover, lower absenteeism, and higher employee productivity. The Q12 Employee Engagement Questionnaire has 12 questions scored on a 5-point Likert scale. Questions range from “In the last seven days, have you received recognition or praise for doing good work?” to “Does the mission/purpose of your company make you feel your job is important?” (SHRM, 2010). This instrument is available in over 30 languages and requires a purchase for use. This online calculator can
help you estimate your school’s cost.

Kern and McQuaid created an online version of the Workplace PERMA-Profiler called The PERMAH Workplace Survey. It measures positive emotion, engagement, relationships, meaning, accomplishment, and health, along with questions relating to self-determination theory. It takes 2-3 minutes to complete and is available in Arabic and English, with more translations to be completed. This version requires the purchase of a 3, 6, or 12 month license costing $497, $797, or $997 respectively. A license may be used as often and by as many people as desired throughout its duration. An expired license can be renewed or the licensee’s data can be de-identified . . . as a .csv file” (The Wellbeing Lab). After the license expires, the organization’s employees can continue to monitor their personal wellbeing with this tool at no cost. With the purchase of any license, scores will be delivered in real time through an online
dashboard, which includes “the number of individuals surveyed, aggregate scores for teams and the overall organization and downloadable reports” (R.Caradine, personal communication, November 12, 2019). All responses are anonymous, and the data are de-identified. This survey has been used with more than 13,000 teachers

Suggestions for Further Research

Psychological capital has been defined as follows:

An individual's positive psychological state of development . . . characterized by: having confidence (self efficacy) to take on and put in the necessary effort to succeed at challenging tasks; making a positive attribution (optimism) about succeeding now and in the future; persevering toward goals and, when necessary, redirecting paths to goals (hope) in order to succeed; and when beset by problems and adversity, sustaining and bouncing back and even beyond (resilience) to attain success (Luthans, Avolio, Avey, & Norman, 2007, p. 3).
The Psychological Capital Questionnaire measures wellbeing as a function of four emotions and dispositions: hope, efficacy, resilience, and optimism. Participants respond to 24 statements on a 6-point Likert scale based on the degree to which they agree with the statement. The PCQ is specifically designed for working adults, relevant to “multiple performance outcomes in the workplace, lower employee absenteeism, less employee cynicism and intentions to quit, and higher job satisfaction, commitment, and organizational citizenship behaviors” (PCQ). There is also a less widely used short version (PSQ-12) with 12 items (Kamei et al., 2018). The PSQ is available in a variety of languages and requires purchase for use.

The Maslach Burnout Inventory: Educator's Survey, a specialized version of the Maslach Burnout Inventory (MBI), was specifically designed for educators including teachers, administrators, staff members, and volunteers working in an educational setting. Focused on individuals’ work environment, this survey assesses emotional exhaustion, depersonalization, and personal accomplishment, including educators’ feelings about their students, their work, and their successes. Responses to this survey's 22 self-report questions are on a 7-point Likert scale according to the frequency the individual identifies with each statement: For example, “I have accomplished many worthwhile things in this job,” or “I feel emotionally drained from my work” (MBI). It can be completed in 10-15 minutes. It is
available in several languages and requires purchase for use.

School Culture Triage Survey

This survey measures three cultural behaviors: professional collaboration, affiliative and collegial relationships, and self-determination/efficacy. It was designed for teachers and administrators, with 17 self-report statements scored on a 5-point Likert scale based on the frequency of occurrence. Such statements include the following: “Teachers and staff discuss instructional strategies and curriculum issues” and “Our school schedule reflects frequent communication opportunities for teachers and staff” (Wagner, 2006, p. 43). Scoring is simple, adding up total points for each question. Scoring information given in advance may affect staff responses. The School Culture Triage Survey has been used in schools “across the United States and Canada.” A correlation has been found between high survey scores and higher state assessment scores (Wagner, 2006, p.42). Only a citation is required for use.
### Pros for Schools  |  Cons for Schools
--- | ---
Simple scoring  |  Assesses only teachers’ and administrators’ perspectives of cultural behaviors
Widely used  |  

**Suggestions for Further Research**

My Class Inventory-Short Form (MCI-SF)

The My Class Inventory-Short Form asks students 25 yes or no questions about five domains of their classroom environment: friction, competitiveness, satisfaction, difficulty, and cohesion. It was designed for elementary school students and tested in schools across Australia. A study done with 2,800 upper elementary students in the United States improved this form by creating an 18-item measure that was found to be more reliable than the original version. This shorter form measures friction, competitiveness, satisfaction, and cohesion. Both measures are scored the same way: A yes response is 3 points, a no is 1 point, and an invalid response is scored as 2. Some items are reverse scored and marked with an R. The inventory requires only a citation for use.
### Pros for Schools

- 2 versions
- Simple scoring
- Can be combined with the teacher version to allow a broader view of culture

### Cons for Schools

- Limited responses as each item is answered with yes or no

### Suggestions for Further Research

School-Level Environment Questionnaires (SLEQ)

School-Level Environment Questionnaire (SLEQ) and Revised School-Level Environment Questionnaire

The SLEQ is specifically designed to measure teachers’ perceptions of their school environment. Due to the evolving nature of the research, a few of the original items and scales have been changed. The SLEQ currently measures student support, affiliation, professional interest, staff freedom, participatory decision making, innovation, resource adequacy, and work pressure. The questionnaire consists of 56 items, each scored on a 5-point Likert scale. The SLEQ is reliable and valid, and it has been used in school studies in Australia, South Africa, and the United States. A shorter revised version is available with 21 items.
across five subscales: Collaboration, Decision Making, Instructional Innovation, Student Relations, and School Resources. This shorter questionnaire, which tests teacher perceptions of those categories, was found to be reliable and valid when tested with 2,558 teachers in elementary, middle, and high schools across “a large urban school district in the southwestern United States as part of a larger survey” (Johnson, Stevens, & Zvoch, 2007, p.835). The questionnaire is free, requiring only a citation for use.

<table>

</tbody>
</table>

**Suggestions for Further Research**

The Omnibus T-Scale measures teachers’ trust in principals, clients (both parents and students), and colleagues. It defines trust as consisting of five factors: benevolence, reliability, competence, honesty, and openness. This survey contains 26 Likert items and has been tested in elementary schools in the U.S. Midwest. It can be used free of charge; the scoring key is online at https://edtechbooks.org/-FYEx.

<table>
<thead>
<tr>
<th><strong>Pros for Schools</strong></th>
<th><strong>Cons for Schools</strong></th>

<td>Measures only one factor (trust) of school climate</td>
</tr>
</tbody>
</table>
Suggestions for Further Research

Similar to the **My Class Inventory-Short Form** for students, this teacher version measures satisfaction, friction, competitiveness, difficulty, and cohesion. However, the form for teachers also measures school counseling impact. It contains 30 items on a 5-point Likert scale and can be completed in about 8 minutes. The TMCI-SF requires only a citation for use. It has been found to be reliable and valid when tested with teachers across grade levels throughout the United States; several modified versions have been created, tested, and also found to be reliable and valid. More information on one modified version can be found in the research section below (Sink & Spencer, 2007).
<table>
<thead>
<tr>

<tbody>
<tr>
<td>Multiple versions with slightly different scales allow for more flexibility</td>
<td></td>
</tr>
<tr>
<td>Can be combined with the student version to enable a broader view of culture</td>
<td></td>
</tr>
</tbody>
</table>

**Suggestions for Further Research**

The ICEQ was designed to assess student perceptions across five scales: personalization, participation, independence, investigation, and differentiation. These scales cover three dimensions: relationship, personal development, and system maintenance/system change. Ten items are provided for each of the five scales. A short form is available consisting of 25 items and a form that measures preferred classroom environment. The ICEQ has been used in schools across Australia and requires only a citation for use.
### Pros for Schools

- Short form with preferred environment form available

### Cons for Schools

- Doesn’t account for influence of larger school environment

### Suggestions for Further Research

The Ed School Climate Surveys are four different tests which measure wellbeing across four populations: instructional staff, non-instructional staff, middle to high school students (Grades 5-12), and parents. Each test covers three main domains: engagement, safety, and environment. The engagement domain measures three subtopics: cultural and linguistic competence, relationship, and school participation. The safety domain includes five: emotional safety, physical safety, bullying/cyberbullying, substance abuse, and emergency readiness/management. The final domain, environment, measures subtopics of physical environment, instructional environment, physical health, mental health, and discipline.
There are slight differences among the tests. The tests for students and parents do not measure physical health. The parent/guardian survey and the emergency management and readiness subtopic in the safety domain are not designed to produce overall scores but can be examined at the individual item level. The student survey has 73 items in an English and a Spanish version. The instructional staff survey has 83 items, the non-instructional staff survey has 104 (a few of them exclusively for principals), and the parent survey has 43 items in both Spanish and English versions.

According to the National Center for Education Statistics (2016) Benchmark study, “The survey platform is designed to be downloadable free of charge and provides user-friendly school climate reports” (p.3). No permission is required. The reliability and validity of these surveys were tested throughout “16 sites, containing 50 public schools” (National Center for Education Statistics, 2016, p.3).

National Center on Safe and Supportive Learning Environments. (n.d.). EDSCLS frequently asked questions. https://edtechbooks.org/-Wqmi
Student Engagement Instrument (SEI)

Cognitive and psychological engagement is the focus of this instrument, intended for students in Grades 6-12 along with school staff. The first SEI version included 30 items relating to cognitive engagement, how students perceive their school experience; and 26 items relating to psychological engagement, how connected they felt. These 56 questions were grouped into six subscales: Teacher–Student Relationships, Control and Relevance of Schoolwork, Peer Support for Learning, Future Aspirations and Goals, Family Support for Learning, and Extrinsic Motivation. Students answered each item on a 4-point Likert scale (Appleton, Christenson, Kim, & Reschly, 2006). SEI has been recently adapted as a shorter version containing 35 items. It is available through the University of Minnesota as the Engage SEI.

Classroom Environment Scale

This scale measures overall classroom climate across three dimensions with nine subscales. The relationship dimension includes subscales measuring involvement, affiliation, and teacher support. The personal growth/goal orientation dimension includes task orientation and competition. The system maintenance and change dimension includes order and organization, rule clarity, teacher control, and innovation. The Classroom Environment Scale is available in three different forms. Form R measures student and teacher perceptions of classroom climate; Form I asks participants about their preferred ideal environment, and Form E assesses students’ and teachers’ expectations for their classroom environment. The 90 items on this scale can be completed in approximately 15 minutes. The Classroom Environment Scale is appropriate for classrooms middle school and above and is available in several languages. It requires a
purchase for use, at costs that vary according to which manuals, online resources, and reports are desired. The right to administer the survey on paper can be purchased at $2.50 per person.
